

What is claimed is

1. A stroller with a basket, comprising:

- a frame assembly having a bottom end and a first block ;
- a plurality of wheels pivotally connected to the bottom end of the frame assembly ;
- a backrest connected to the frame assembly ;
- a seat connected to the frame assembly and located under the backrest ; and
- a basket connected to the frame assembly and located under the seat, the basket having a basket body and a basket frame which is adjoined to the basket body and pivotally connected to the frame assembly ;

whereby, the basket can be adjusted in height by means of altering the position of the basket frame relative to the first block.

2. The stroller with the basket as claimed in claim 1, wherein the frame body respectively has the first blocks at both sides for supporting the basket frame.

3. The stroller with the basket as claimed in claim 1, wherein the basket frame is flexible so as to change the position thereof relative to the first block.

4. The stroller with the basket as claimed in claim 2 or 3, wherein the first block respectively has an inclined side surface adjacent to the seat and the wheels, and the inclination of the former is smaller so as to enable the first block to securely support the basket frame and stretch the basket body.

5. The stroller with the basket as claimed in claim 1, wherein the basket frame is telescopic and further has a second block, so that when the basket frame is in a retractive position, the second block touches with the first block, while when the basket frame is in a stretchy position, the second block separates from the first block.

6. The stroller with the basket as claimed in claim 5, wherein the basket frame has an inner rod having a slot, an outer rod telescopically coupled with the inner rod, and an elastic element accommodated in the inner rod; and a fastener penetrates the second block, the outer rod, and the slot and at the same time restricts the elastic element at an end of the inner rod.

7. The stroller with the basket as claimed in claim 5, wherein the first block has a block body and an ear, having a curved surface abutting to the frame assembly to prevent the second block from moving.

8. The stroller with the basket as claimed in claim 7, wherein the block body has a first side and a second side with different inclination so as to securely support the

basket frame and adjust the basket frame in height.

9. The stroller with the basket as claimed in claim 5, wherein the frame assembly respectively has the first blocks at both sides and also the basket frame correspondingly has two second blocks.
